

José Manuel Martín Durán : De Think.

From a teaching point of view, the final product of the project denotes a high quality. That is, the development of a place to consult the different strategies and methodologies that we can use with our students will help the educational community to embark on teaching with active methodologies based on entrepreneurial techniques. And thus complement the more traditional teaching with a new approach that helps to develop in students and teachers a series of competencies and skills necessary for professional and personal development in the future, preparing all of us, teachers and students to be part of the "Digital Knowmad" community, which is yet to come.

This project is a feasible reality and is currently in the process of implementation, where the resources developed in it have facilitated the implementation of entrepreneurial techniques based on the design thinking and improve the effective learning of students throughout their educational process. This is why I consider that a project of this type helps the entire educational community in a collateral way, even though only a small number of teachers use these techniques in the normal development of their teaching planning.

I do not want to pass up the opportunity to evaluate the website itself, as it is not very intuitive and too monotonous. I believe that the visual image is the first source of information for everyone, so it would be necessary to improve it by using better quality infographics with less text and even the specific work of visual thinking techniques in its development.
